EXAMINER'S AMENDMENT

- An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.
- *The application has been amended as follows:*
- On the first page of the specification, after the title of the invention, please insert, "This Application is a 371 of PCT/FI05/50139 filed on 04/29/2005".

REASONS FOR ALLOWANCE

- The following is an examiner's statement of reasons for allowance: The present invention is directed towards a method and apparatus for downsampling a digital matrix image by selected ratios. The closest prior art, Kumar (USPAP 2007/0133902 A1), shows a similar system, in which, a method and circuit for de-mosaicing and downscaling image data (e.g., image data in raw Bayer image format) in a single, integrated operation, rather than two separate and sequential de-mosaicing and downscaling operations. Some embodiments of the method include a step of displaying the de-mosaiced and downscaled data (e.g., on an LCD of a digital camera to perform an image preview operation). In typical embodiments, the method includes the steps of: determining sampling points (one sampling point for each output image pixel) and filtering the input image data to generate color component values of output image data (e.g., red, green, and blue color components of output image data in RGB format) at each sampling point without producing unacceptable aliasing artifacts. In typical embodiments, the filtering step implements an edge adaptive interpolation algorithm and performs color correlation between red and green channels and between blue and green channels to reduce aliasing artifacts. However, Kumar

fails to address: "for using scaling to form an output matrix, of a size $M_2 \times N_2$, the pixels corresponding to sub-groups of the original matrix, in such a way that $M_2 \leq M_1$ and $N_2 \leq N_1$, and from the values $\text{Input}(i,j)$ of which pixels (i,j) the value $\text{Output}(l,k)$ of each output pixel (k,l) of the output matrix is calculated, forming the weighted sums of the values of the same-colour pixels (i,j) of the matrix image in the area of each output pixel (k,l) parallel in line memories arranged for each colour, calculating for each input pixel a weighting coefficient representing the dimension share of the pixel (i,j) in the area of the output pixel (k,l) , and correcting each weighted sum by a scaling factor". These and similar distinct features have been added to each independent claim and renders them allowable.

- Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
